

ABSTRACT OF THE DISCLOSURE

An electromagnetic (EM) shielding assembly can comprise an electrically  
conductive shielding portion and one or more electrically conductive protrusions for  
5 engaging with respective conductive apertures in a circuit board. The electrically  
conductive protrusions can be in electrical communication with the EM shielding portion.  
The protrusions can enable the EM shielding assembly to be attached to a circuit board in  
a computer system while also providing an electrical connection to logical ground.  
Further components, for example a heat sink that may be in electrical communication  
10 with the EM shielding portion, may thereby also be connected to logical ground.
